MHT Technologies

Terminal troubleshooting for Node 90

Inxip:

The inxip parameter represents the IP address of Aida. It must be set to the Aida IP where the nodes are connected, ensuring they can be controlled through Aida.

To configure inxip in the terminal:

1. Navigate to Nodes.

2. Select the Node Name/Serial you want to update.

3. Set the Request Type to PUT.

4. In the Data field, enter the Aida IP Address.

After Sending Command to Node, under Request Type, select "Get" to see the update.

REQUEST TYPE	NODES	OR IP	PAGE
PUT	ND-34413	Enter IP here	network

CONTEXT	QUERY	DATA TYPE	DATA
inxip	Enter query here	String	10.10.10.10

🚀 Send Command To **Node**

CCCV:

CCCV Configuration

The **CCCV value** represents the node's voltage in multiples of 12.

- **1** = 12 Volts

- **2** = 24 Volts

- **3** = 36 Volts

- **4** = 48 Volts

To configure **CCCV** in the terminal:

1. Select the **PUT** request type.

2. In the **Data** field, enter the desired **CCCV value**.

3. Under *Actuators*, set the **Subpage** to **Actuator 1** or **Actuator 2** (as shown in the diagram below).

After Sending Command to Node, under Request Type, select "Get" to see the update.

Wattage

Wattage Configuration

- The Wattage parameter defines the total power delivery (in watts) of a node. Each node has specific power delivery limits, and the output power is distributed across its actuators.

- The wattage values you set must account for both the node's power capacity and the light fixture requirements, so they need to be selected carefully.

To configure wattage:

- Select the parameters for Actuator 1 as shown in the diagram.

- Repeat the same process for Actuator 2 in its subpage.

- In the Data field, enter the desired wattage multiplied by 10.

- Example: To set 12W on Actuator 1, enter 120 in the Data field.

After Sending Command to Node, under Request Type, select "Get" to see the update.

        "maxw": "120",
```

Motion

Motion Enable/Disable Configuration

- You can enable motion on a node when pairing it with an occupancy or motion sensor. The motion variable is motdsbl, which accepts the following values:

- 33 = Motion enabled

- 3 = Motion disabled

- Note: Motion only needs to be enabled on Actuator 1. There is no need to configure it for Actuator 2.

- Refer to the diagram below for setup instructions.

Path Assembly

REQUEST TYPE	NODES	OR IP	PAGE	SUBPAGE	PROPERTY

```

FadeTime

FadeTime determines how long it takes for the lights to turn off:

- 0 seconds = instant lights out

- 2 seconds (recommended) = smooth, gradual fade out

To configure FadeTime:

1. Select the parameters as shown in the diagram below.

2. In the Data field, enter the desired fade time in milliseconds (value × 1000).

   o Example: For a 2-second fade, enter 2000.

After Sending Command to Node, under Request Type, select "Get" to see the update.

Motion policies

Motion sensor Policy Type

You can configure motion sensor Type on a node to define how lights respond:

- manual,vac = Manual ON / Auto OFF

- mot,vac = Auto ON / Auto OFF

To apply a motion sensor Policy Type:

1. Open the terminal and select the parameters as shown in the diagram below.

2. In the Data field, enter the appropriate policy string (manual,vac or mot,vac).

After Sending Command to Node, under Request Type, select "Get" to see the update.

Path Assembly

REQUEST TYPE	NODES	OR IP	PAGE	SUBPAGE	PROPERTY

Scene Policies

Scene Policy Configuration

Policies can be assigned to scenes 1, 2, and 3 to control settings such as brightness. For example:

- Scene 1 → Brightness = 75

- Scene 2 → Brightness = 50

- Scene 3 → Brightness = 25

Refer to the diagram below for how to configure these scene values.

After Sending Command to Node, under Request Type, select "Get" to see the update.

}
```

Motion and Vacancy

Motion & Vacancy Policy Configuration

In the example below:

- When motion is detected, the light brightness is set to 95% (from 0%).

- After 5 minutes of no motion (vacancy), the brightness gradually returns to 0%.

To configure:

1. Set the motion policy so that when motion is triggered, the node reaches 95% brightness.

2. Configure the vacancy timer to reduce brightness to 0 after 5 minutes of inactivity.

After Sending Command to Node, under Request Type, select "Get" to see the update.

```

MHT Technologies

Percentage Power in Brightness

The pp value controls the brightness of the node:

- 100 = Maximum brightness
- 0 = Lights off

You can configure the pp value on Actuator 1, Actuator 2, or both. Follow the steps below:

1. Select the actuator(s) you want to configure.
2. Enter the desired pp value in the Data field.

After Sending Command to Node, under Request Type, select "Get" to see the update.

In the below example, pp is set to '53' on Actuator 2.

Path Assembly

REQUEST TYPE	NODES	OR IP	PAGE	SUBPAGE	PROPERTY
PUT	ND-34413	Enter IP here	actuators	actuator2	Select

CONTEXT	QUERY	DATA TYPE	DATA
pp	Enter query here	String	53

"power": 0,
"vout": 0,
"iout": 0

Clusters:

A **cluster** is a group to which a node—or multiple nodes—can belong. You can also assign a **motion sensor** or **wall switch** to a cluster.

- When the **ON** button on a wall switch is pressed, it will control only the nodes within the same cluster.

- This allows different rooms or areas in a building to have separate clusters, each with their own wall switches and motion sensors.

Example: In the terminal below, the nodes **upOffice1** and **downOffice1** belong to the same cluster because they share **Cluster ID "41"**.

Path Assembly
